(57) ABSTRACT

A technique for wireless communication is provided. According to an example embodiment, the technique comprises selectively operating a wireless transceiver in an apparatus in one of a first state and a second state in dependence of sufficiency of operating power available for the apparatus, wherein the first state is an operational state where the wireless transceiver is discoverable and connectable by other devices and wherein the second state is an operational state where the wireless transceiver is discoverable but not connectable by other devices, determining whether sufficient operating power is available for the apparatus, and operating the wireless transceiver in the first state in response to the determination being affirmative and otherwise operating the wireless transceiver in the second state.
